

Python Basics

Python is a high-level programming language used for web development, automation, data analysis, artificial intelligence, and machine learning.

Variables

A variable stores a value. For example, `name = 'Saad'` stores text in a variable called `name`.

Lists

A list stores multiple values in an ordered collection. Example: `numbers = [10, 20, 30]`.

Functions

A function is a reusable block of code. Functions can accept inputs and return outputs.

Loops

A for loop repeats code for each item in a sequence. A while loop repeats code while a condition is true.
